Alerting Abstract US B1

NOVELTY - The method involves accessing personalized information for multiple individuals. Personalized markup documents are generated for each of individuals from the personalized information. Each of the personalized markup documents are converted into encoded signals. A composite signal is generated from each of the encoded signals. The composite signal is broadcasted to radio receivers of the multiple individuals.

DESCRIPTION - An INDEPENDENT CLAIM is also included for a system for providing multiple individuals with personalized information through a personalized broadcast.

USE - Used for providing individual's personalized information in an on-line analytical processing system.

ADVANTAGE - The method effectively provides a voice service that leverages power of on-line analytical processing system or other data repository system, thus providing critical information to a user, in a timely fashion, and hence providing a user with an opportunity to immediately act upon information received during an interactive voice broadcast.

DESCRIPTION OF DRAWINGS - The drawing shows a block diagram of a personalized broadcast system.

Alerting Abstract US A1

NOVELTY - A user creates a personal profile and specifies a scheduling condition when subscribing to an entertainment voice service to generate an entertainment information. An interactive voice-enabled communication session is established to the user when the scheduling condition is satisfied. The entertainment information is shown to the user during the communication such that the user can respond to the information.

USE - For providing entertainment information to user subscribing to

entertainment voice service.

ADVANTAGE - Provides opportunity to user to input additional information based on input about opportunity to reserve or purchase entertainment opportunity, during telecast from entertainment voice service.

DESCRIPTION OF DRAWINGS - The figure shows the flowchart for real-time transmission of entertainment information.

NOVELTY - The personalized mark-up documents are generated for several individuals, from the accessed personalized information. The personalized mark-up documents are converted into a format suitable for transmission. The converted personalized mark-up document is transmitted to several individuals.

DESCRIPTION - An INDEPENDENT CLAIM is also included for system for providing personalized information.

USE - For providing personalized interactive, dynamic voice service information through personalized broadcast in on-line analytical processing (OLAP) system.

ADVANTAGE - Enables to leverage the power of OLAP or other data repository system by the voice service. Enables to provide critical information to the user in a timely fashion by phone. Enables the user to immediately act on information received during an interactive voice broadcast.

DESCRIPTION OF DRAWINGS - The figure shows a schematic view of communication transaction processing system.

NOVELTY - An outbound communication is initiated to a user, to establish an interactive voice-enabled communication with the user, when scheduling condition created by the user is satisfied. The user is dynamically interacted during the communication, by presenting with entertainment information related to an entertainment opportunity, from a personalized markup language document with embedded user prompts, generated for the user.

DESCRIPTION - An INDEPENDENT CLAIM is also included for system for providing real-time transmissions of entertainment information.

USE - For providing real-time transmissions of entertainment information related to entertainment opportunities such as TV shows, movies, plays and bowling event, to user of networked computer terminal, telephone, two-way pager and personal digital assistant (PDA).

ADVANTAGE - Provides efficient transmission of real-time entertainment information to the user.

DESCRIPTION OF DRAWINGS - The figure shows a block diagram of the intelligence server.

Alerting Abstract US B1

NOVELTY - The system has channel databases with informational data about a subject matter of interest e.g. business, weather. The information is organized into channels that provide predefined services based on the stored content. A subscription receiving unit to receive requests from the users. A service processing unit to process each request based on stored information to schedule services that are output to subscriber devices.

DESCRIPTION - Each subscription request has a selection of channel, service for each channel, and personalized feature for each service of each selected channel. An INDEPENDENT CLAIM is also included for a method for delivering personalized intelligence to subscribers.

USE - Used for delivering personalized intelligence and transactional data to users through content delivery device e.g. electronic mail, spreadsheet program, pager, telephone, mobile phone, fax, personal digital assistant, HTML electronic mail, WAP device.

ADVANTAGE - The service processing unit process each request based on the informational data stored in the channel databases to schedule services, thereby accurately delivering the information at right time.

DESCRIPTION OF DRAWINGS - The drawing shows a method of processing services.

Alerting Abstract US B1

NOVELTY - The system has an output forwarding unit for automatically forwarding the output of a service processor to specified subscriber output devices. The service processor is provided for processing the channel selection, server selection and personalization selection for each subscriber based on information obtained from the channel databases.

DESCRIPTION - The service process generates the report by an online analytical processing (OLAP) system that includes the processing results for channel, service and personalization inputs for each subscriber. The OLAP system processes reports against the information contained in the channel databases. A subscription receiver obtains the subscriptions from several users, in which each subscription includes the channel selection, channel service and personalized feature for each service of each channel selected. The channel databases contains information about different subject matters e.g. finance channel, sports channel, weather channel, travel channel, business channel, news channel.

An INDEPENDENT CLAIM is included for the delivery of personalized intelligence to subscribers.

USE - For subject-based channel distribution of automatic, real-time delivery of personalized information and transactional data.

ADVANTAGE - Provides several channels of personal intelligence content to enable subscribers to more specifically choose the content they desire to receive. Enables users to more easily identify the content they want and provides more options to customize fees that may be charged to the subscriber. Provides content from which personalized intelligence network actively delivers highly personalized and timely informational and transactional content to subscribers via email, spreadsheet programs, pager, telephone, mobile phone, fax, personal digital assistants, HTML email, and other formats to generate revenues from subscription fees, transactional fees, bundling fees and advertising fees. Includes local, national and international data to enable users to receive a wide variety of information and data. Provides user with information required to make completely informed decisions faster, easier and cheaper.

DESCRIPTION OF DRAWINGS - The figure is a schematic diagram showing the flow of information in the personalized intelligence network.

Alerting Abstract US B1

NOVELTY - A control server communicates with a facility for processing the service for each of the subscribers. The server divides the services into jobs that are processed by assembling the output to be delivered to a subset of subscribers associated with output servers, using a mid-tier slicing of common information from channel databases.

DESCRIPTION - An INDEPENDENT CLAIM is also included for method for generation and delivery of message content to subscribers.

USE - For generating, organizing and delivery of transactional contents such as news, business and weather reports from on-line analytical processing (OLAF) system to subscribers using e-mail, pager, mobile telephone, facsimile, telephone, personal digital assistant, wireless-access-protocol (WAP) device.

ADVANTAGE - Provides a high through-put output system for processing several output to large number of subscribers, thus enabling the users to take the right decisions by delivering the contents right into their hands.

DESCRIPTION OF DRAWINGS - The figure shows a flowchart explaining the method of processing services.

Alerting Abstract US B1

NOVELTY - A data distribution control server processes each service for each subscriber, by using structured query language, procedures and filters stored in a data distribution repository. The server detects state information of the data distribution repository, including updates occurring to the repository, to maintain coherency and integrity of retrieval and transmission of personalized content to the subscribers.

DESCRIPTION - An INDEPENDENT CLAIM is also included for data warehousing method.

USE - For real-time delivery of business information, weather information, news and other topical information to subscribers. Provides the user with the information required to make completely informed decisions quickly and easily, at low cost.

ADVANTAGE - Enhances the reliability of high-throughput information service.

DESCRIPTION OF DRAWINGS - The figure shows the data warehousing system.
